CS110 Project - Battleship, Part II

In Phase I, you created the foundational classes for the game of Battleship. In Phase II, you will add a Game class and a driver. None of the methods in this Game class should be complicated (1-5 lines of code in the body). Be sure your toString() methods are labelling the boards (see sample output). Ideally, you should not need to make changes to the classes developed in Phase I, however, now is the time for fixes, if needed. These fixes may be in implementation of methods, the public interface of all classes written in Phase I must remain the same.

UML for Game class:

You will find descriptions of the methods of this class on subsequent pages.

Once your Game class is complete, write the BattleShipDriver class to fully implement the game. The driver class contains the main() method and provides the interface between the user and the Game class. I have provided sample runs to demonstrate the required functionality. Note: reasonable input validation and exception handling is expected.

Algorithm for driver:

- Create game
- Decide who goes first ("flip a coin")
- While computer's entire fleet isn't sunk and user's fleet isn't completely sunk
 - o If it's player's turn
 - Get player's move (parse it)
 - Make move
 - o Else If it's computer's turn
 - Make random move (hint: makeComputerMove in UserBoard handles this)
 - Update board
 - Display board
- Display "game over" and message indicating who won.

Game class methods

Game

- Creates the two boards (file names are fixed "compFleet.txt" and "userFleet.txt", no need to prompt for them or pass in filename)

makeComputerMove

- Calls a method on the player board which makes a move against that board.
- Returns an array of two Strings. The first is the move the computer made in user readable form. The second is either null, or, if the move resulted in a ship being sunk, a string along the lines of "You sunk my Battleship!" [HINT: look at makeComputerMove in Board class]

makePlayerMove

- Calls a method on the computer board which makes a move against that board.
- Returns either null, or, if the move resulted in a a ship being sunk, a string along the lines of "You sunk my Battleship!" [HINT: look at makePlayerMove in Board class]

userDefeated

- Checks to see if the player has been defeated.
- Returns True if all player ships have been sunk, false otherwise.

computerDefeated

- Checks to see if the computer has been defeated.
- Returns True if all computer ships have been sunk, false otherwise.

toString

- Returns a string representation of both boards well labelled

Grading Rubric

	Points					
Full java docs across all files	10					
Good programming style	10					
Reasonable exception handling						
All ship classes implemented according to UML	5					
All Board classes implemented according to UML	5					
Fleet class implemented according to UML	5					
Enumerated types implemented according to UML (and used)	5					
Game class implemented according to UML						
Driver class functionality						
Randomly choose which player goes first	5					
Get user move, case insensitive, validate	5					
Successfully execute move, updating board, message as appropriate	10					
Generate random computer move (no duplicates)	5					
Successfully execute move, updating board, message as appropriate	10					
Clean, well labelled display of both boards	10					
Execute until one fleet is sunk, message indicating who won	5					

Sample program run:

Using the files:
